

Netlify Forms Configuration

KiguDev portfolio contact form | Completed 23 September 2026

Outcome

The live contact form in **src/components/Portfolio/HomePortfolio.astro** is now discoverable by Netlify at deploy time and submits through AJAX without leaving the page. Existing validation and styling were retained, with clear sending, success, and failure feedback added.

Area	Configuration applied
Detection	name="portfolio-contact" , method="POST" , and data-netlify="true"
Submission	POST to the site root using application/x-www-form-urlencoded
Identification	Hidden form-name=portfolio-contact field included
Spam control	Netlify honeypot enabled with bot-field
User feedback	Submit button lock plus accessible live status messages

Steps completed

1. Added deploy-time form metadata

Assigned the unique form name, POST method, root action, and Netlify detection attribute to the actual homepage form.

2. Added explicit form identification

Included a hidden form-name input so the AJAX payload is associated with the same form Netlify detects in the generated HTML.

3. Added a honeypot

Configured data-netlify-honeypot and a hidden bot-field to reject basic automated submissions without changing the visible form.

4. Connected the existing submit handler

After client-side validation, the handler serializes FormData with URLSearchParams and POSTs it using the encoding required by Netlify Forms.

5. Added resilient UI states

The submit button is disabled while sending. An aria-live status region announces progress, success, or failure, and the form resets only after a successful response.

Resulting form signature

```
<form name="portfolio-contact" method="POST" action="/"
data-netlify="true" data-netlify-honeypot="bot-field">
  <input type="hidden" name="form-name" value="portfolio-contact" />
```

Verification performed

Astro check: 59 files checked, 0 errors, 0 warnings, 0 hints.

Production build: completed successfully, 13 static pages generated.

Generated HTML: confirmed that dist/index.html contains the Netlify form attributes and hidden form-name input.

Deployment step still required

In the Netlify site dashboard, open **Forms > Form detection** and confirm detection is enabled, then redeploy the site. Netlify scans the completed static HTML during deployment; the form should then appear as **portfolio-contact**. Submission notifications, if desired, are configured separately under **Forms > Submission notifications**.
